In 2025, global Ethyl Carbazate sales volume is estimated at approximately 1,100 tons, with an average global market price of around USD 16/kg. The gross margin of major manufacturers in the industry is estimated to range from 5% to 38%.

Ethyl Carbazate is an important hydrazine-based fine chemical intermediate, with the CAS number 4114-31-2. It is typically a white to off-white crystalline solid and has dual reactivity derived from both ester and hydrazide functional groups, enabling it to participate in condensation, substitution, acylation, and heterocycle-forming reactions. The product is mainly used in medicine, pesticide, and fine chemical synthesis routes, often serving as a basic intermediate for introducing hydrazine, hydrazide, and nitrogen-containing heterocyclic structures. Its downstream applications require certain standards for purity, impurity control, appearance, and batch-to-batch consistency.

The upstream raw materials mainly include hydrazine hydrate, ethyl chloroformate, diethyl carbonate, solvents, catalysts, and refining auxiliaries. In the midstream segment, fine chemical manufacturers produce industrial-grade or medicine-grade products through hydrazinolysis, separation, crystallization, drying, and purification processes. Downstream, Ethyl Carbazate is mainly used in medicine intermediates, pesticide intermediates, and other fine chemical fields.

United States market for Ethyl Carbazate is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
