Abstracts

The global Ethylene Glycol Diether market size is predicted to grow from US$ 209 million in 2025 to US$ 329 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

In 2025, global sales volume of Ethylene Glycol Diether was approximately 95,000 tons, with a mainstream producer-level average price of about US$2,250 per ton. The global market size was approximately US$214 million, and gross margins of major manufacturers in the industry were generally around 18%–30%.

Ethylene Glycol Diether refers to a class of diether compounds formed by the complete etherification of both hydroxyl groups in an ethylene glycol molecule, with a typical structure of R–O–CH?CH?–O–R'. These products no longer contain hydroxyl groups and generally exhibit strong solvency, low viscosity, good chemical stability, and certain polarity. Typical products include ethylene glycol dimethyl ether, ethylene glycol diethyl ether, and ethylene glycol dibutyl ether. Since the ether groups at both ends can be either identical or different alkyl groups, Ethylene Glycol Diether can be classified into symmetrical and asymmetrical products. Different alkyl structures affect boiling point, volatility, solubility, and downstream application suitability.

Ethylene Glycol Diether offers strong solvency, high polarity, and good chemical stability, and can be used as a reaction solvent, extraction solvent, and functional additive. Its upstream raw materials mainly include ethylene glycol, methanol, ethanol, butanol, and other feedstocks, while downstream applications are concentrated in lithium battery electrolytes, pharmaceutical and agrochemical intermediates, electronic chemicals, and industrial solvents. Among them, ethylene glycol dimethyl ether is the most representative product and is widely used in electrochemical systems, fine
