Europium nitride is a semiconductor that contains non-magnetic Eu^{3+} , but substoichiometric europium nitride contains a mixture of Eu in the $2+$ and $3+$ charge states. The results show that when the concentration of Eu^{2+} is close to 15% ~ 20%, the silver is ferromagnetic and the Curie temperature is up to 120 K. The polarization of Eu^{3+} follows that of Eu^{2+} , which demonstrates the intrinsic ferromagnetism of EUN and, therefore, is a new type of diluted magnetic semiconductor. Transport measurements revealed possible exchange mechanisms.

Europium nitride is a semiconductor that contains a non-magnetic $3+$, but substoichiometric europium nitride contains a mixed charge state of $2+$ and $3+$. We show that at $2+$ ~ concentrations around 15-20%, silver is ferromagnetic and Curie temperatures up to 120 K. The polarization of $3+$ ~ are the same as that of $2+$, which confirms the inherent ferromagnetism of the silver atom. Therefore, the silver atom is a new type of diluted magnetic semiconductor. Transport measurements revealed possible exchange mechanisms.
