Abstracts

The global EV Charging Cable Cooling System market size is predicted to grow from US\$ 499 million in 2025 to US\$ 1268 million in 2032; it is expected to grow at a CAGR of 14.1% from 2026 to 2032.

EV Charging Cable Cooling System refers to an active thermal-management subsystem used to remove resistive heat from a high-power DC charging cable, its power conductors, DC contacts or a combination of these components.

A typical system includes a liquid-cooled charging connector and cable assembly with internal coolant channels, supply and return lines, temperature sensors and coolant interfaces. A more integrated system may also include a circulation pump, reservoir, heat exchanger, fan, filter, flow sensor, pressure sensor, leak-detection device and electronic controller.

The 2025 benchmark ASP is US\$5,500 per unit, modeled global sales volume is approximately 92.727k units, and the estimated average gross margin is approximately 27%.

The upstream industry chain includes copper conductors, silver-plated contacts, engineering plastics, elastomer hoses, polyurethane cable jackets, seals, sensors, pumps, heat exchangers, fans, reservoirs, filters, coolants and electronic controllers. The midstream includes connector design, cable extrusion, coolant-channel manufacturing, contact assembly, sealing, sensor integration, cooling-unit assembly, electrical testing, pressure testing, leak testing, thermal testing and certification. The downstream mainly covers public fast charging, fleet depots, commercial vehicles, heavy-duty road transport, ports, mines and other professional charging infrastructure.

High charging current generates resistive heat in the power conductors and contact interfaces. Because heat generation rises approximately with the square of current, substantially increasing current without cooling would require larger copper cross-sections, resulting in a heavier, thicker and less ergonomic cable.

Liquid cooling allows the system to remove heat close to the conductor or DC contact. The cable can therefore transmit higher current while remaining lighter and easier to handle than a conventional passively cooled cable designed for the same peak current.

Passenger-car HPC systems commonly operate in the several-hundred-kilowatt range. MCS systems for electric trucks and heavy equipment require higher continuous current and substantially greater heat removal.

Phoenix Contact identifies MCS as a standard intended for utility-vehicle charging at power levels up to 3.75 MW. Stäubli's liquid-cooled MCS product is designed for multi-megawatt charging, while HUBER+SUHNER has introduced MCS products for continuous currents above those of conventional CCS systems.
