The global Evacuation Slide Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The incidence of aircraft accidents has compelled manufacturers and authorities to make several new considerations related to the emergency response & safety of aircrafts. Of these, aircraft evacuation slides are among the most important safety systems. Evacuation slides are inflatable slides installed in all aircrafts that carry civil as well as military personnel. Aircraft evacuation slides are designed to facilitate the immediate evacuation of passengers from aircrafts during emergencies. Generally, the sill height of the aircraft door is more than 6 feet above the ground, owing to which passengers are likely to suffer from injuries during emergency evacuation. To avoid this, the installation of aircraft evacuation slides in all aircrafts is compulsory to enable quick and safe evacuation of on-board passengers. Aircraft evacuation slides are mainly of two types: aircraft evacuation slide and slide & raft. Aircraft evacuation slides are used for inland evacuation and the slide & raft arrangement is used during water landing as it can also be used as a life raft. Aircraft evacuation slides are single- as well as dual-lane depending upon the width of the exit of the aircraft as well as passenger capacity. This is because the dual lane is capable of evacuating more passengers at a time. The evacuation slide is installed within the door structures inside the slide bustle. During emergencies, time is an extremely crucial factor. Keeping this in mind, manufacturers are undertaking R&D activities to increase the efficiency of aircraft evacuation slides. In modern aircrafts, evacuation slides are fitted in such a way that at the time of emergency, they will automatically open when the door opens, thus saving time as well

as saving more lives.
