Preparation of film layers in vacuum, including deposition of crystalline metal, semiconductor, insulator, and other elemental or compound films. Although chemical vapor deposition also uses vacuum methods such as reduced pressure, low pressure, or plasma, vacuum coating generally refers to the deposition of thin films using physical methods. There are three forms of vacuum coating, namely evaporation coating, sputtering coating, and ion plating. Evaporative coating is a technology that uses resistance or Electron-beam furnace coating materials under vacuum conditions to evaporate its atoms or molecules from the surface and deposit them on the substrate surface to form films. This technology has the characteristics of wide application range, highly controllable film thickness, mature technology, low cost, etc

Semiconductor manufacturing equipment is a medium tool for achieving semiconductor manufacturing processes, playing an important role in all aspects. According to SEMI, worldwide sales of semiconductor manufacturing equipment increased 5% from \$102.6 billion in 2021 to an all-time record of \$107.6 billion in 2022. In recent years, the localization process of China's semiconductor industry has further accelerated, and the performance of semiconductor equipment is more flexible than the overall industry. The localization of semiconductor equipment is ushering in a golden wave, and domestic semiconductor equipment is facing more opportunities for verification and trial use, technical cooperation, and import substitution. For the third consecutive year, China remained the largest semiconductor equipment market in 2022 despite a 5% slowdown in the pace of investments in the region year over year, accounting for \$28.3 billion in billings.
