An evaporative cooling fan is a type of fan that uses the process of evaporation to cool the air. These fans typically have a water reservoir that is used to moisten a cooling pad or filter. As the fan blows air through the moistened pad, the water evaporates, which helps to lower the temperature of the air passing through the fan. Evaporative cooling fans are often used in hot and dry climates where traditional air conditioning may not be as effective or cost-efficient. They are also more energy-efficient than traditional air conditioning units, making them a popular choice for cooling outdoor spaces or rooms with good ventilation. Overall, evaporative cooling fans can provide a cost-effective and environmentally friendly way to cool a space, especially in areas with low humidity levels.

The global Evaporative Cooling Fan market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
