Ivolumus drug eluting stents are typically composed of a metal scaffold and a drug coating covering the surface of the scaffold. Metal brackets are usually made of biocompatible materials, such as stainless steel, chromium cobalt alloy, etc. The drug coating of the stent contains Everolimus, an immunosuppressive drug. The drug will be released onto the vascular wall around the stent, thereby inhibiting intimal hyperplasia and reducing the risk of vascular restenosis. Ivolumus drug eluting stents work in two ways: metal stents provide mechanical support to maintain vascular patency; The drug coating releases everolimus, inhibits vascular intimal hyperplasia, and reduces the possibility of vascular restenosis.
