## Abstracts

The global Ex Vivo Organ Perfusion Technology market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Ex vivo organ perfusion technology involves the process of preserving and maintaining organs outside of the body in a functioning state by continuously perfusing them with a specialized solution. This technology allows for the assessment, preservation, and even treatment of organs before transplantation. During ex vivo organ perfusion, the organ is connected to a perfusion system that delivers oxygenated blood or a preservation solution containing nutrients and medications to maintain cellular viability and function. This method enables the evaluation of organ quality, assessment of viability, and potential repair or treatment of organs that may not be suitable for transplantation using traditional methods. Ex vivo organ perfusion technology has the potential to increase the number of viable organs available for transplantation, improve transplant outcomes, and advance research in organ preservation and regeneration.
