The global Exhaust Gas Economizer (EGE) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

When the main engines run it gives out exhaust gas which is used by the exhaust gas turbocharger. Even after the usage of the exhaust gas there is a good amount of heat energy remaining in it. The exhaust gas has a temperature around 200°C. Which is utilized by the economizer. The water is taken from the water drum with help of a centrifugal pump, which is passed the tubes present in the exhaust gas economizer. The exhaust gas containing around 200 °C is passed through outside of the tube where the water is heated. Later it is passed to a steam drum and further used for different purposes.
