The global Exoskeleton Assistance System market size is predicted to grow from US\$ 517 million in 2025 to US\$ 1741 million in 2032; it is expected to grow at a CAGR of 19.3% from 2026 to 2032.

An exoskeleton assistance system, also known as an exoskeleton, is a wearable robotic device designed to augment, support, or enhance the physical capabilities of its user. These systems consist of a powered or unpowered external frame that is worn on the body, typically over the limbs, and often mimic the structure and function of the human skeleton. The primary purpose of exoskeletons is to assist individuals in performing various activities, particularly those that involve physical strength, endurance, or mobility. Exoskeletons have applications in medical rehabilitation, industrial settings, and military contexts.

Advancements in materials and manufacturing techniques contribute to the miniaturization and lightweight design of exoskeletons. This trend aims to improve user comfort, reduce fatigue, and increase overall wearability.
