An Exoskeleton Glove is a wearable assistive device designed to support hand and finger movements by providing mechanical assistance, force amplification, or motion guidance. It typically combines a glove structure with actuators, transmission mechanisms, sensors, controllers, and a portable power source. Depending on its design, the device can assist grasping, finger flexion, extension, or repetitive hand movements. Exoskeleton Gloves are used in industrial ergonomics, rehabilitation, assistive technology, human-machine interaction, and selected medical applications. Products are differentiated by actuation method, assistance force, number of assisted fingers, control mechanism, weight, battery life, and intended application.

The upstream industry supplies flexible materials, structural components, miniature motors or actuators, gears, cables, sensors, batteries, electronic components, controllers, and communication modules. The midstream industry integrates mechanical structures, actuation systems, sensing components, control electronics, embedded software, and wearable interfaces, followed by calibration and functional testing. Products are differentiated by mechanical or pneumatic actuation, assistance level,
