The global Exosome-mediated Delivery System market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

With the advantages of safety, high biocompatibility, high bioavailability, and the ability to penetrate the blood-brain barrier, exosomes have become increasingly promising and potential carriers for RNA drug delivery. Exosomes are small extracellular vesicles released by cells, playing a crucial role in communication between different cell types. Exosomes offer a promising alternative for RNA delivery. Exosomes, unlike other vectors for gene delivery, present unique advantages such that exosomes are a cell-free natural system for ferrying RNA between cells, robust exosomal membrane can protect the RNA/gene of interest from digestion, and exosomes are rapidly taken up by target cells making them a more efficient vehicle for gene delivery. They are generally well-tolerated by the immune system, reducing the risk of adverse reactions. Additionally, they exhibit natural targeting capabilities, allowing them to selectively deliver their cargo to specific cell types or tissues. This ability to target specific cells greatly enhances the therapeutic potential of exosomes for RNA delivery.
