The global Exosome Service market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Exosome service refers to the provision of services related to exosomes, which are small extracellular vesicles that play a crucial role in intercellular communication. Exosomes are released by various cell types and contain proteins, lipids, and nucleic acids that can be transferred to recipient cells, influencing their function and behavior. Exosomes are small (~40?150 nm) extracellular vesicles (EVs) released from all cell types and found in body fluids and cell culture supernatants. Exosomes are generated by fusion of a specialized endosome, the multivesicular body (MVB), with the plasma membrane. Exosomes have been proposed to provide means for intercellular exchange of macromolecules, allowing the transfer of proteins, lipids, mRNA and miRNA, contributing to intercellular communication in relevant biological processes, including apoptosis, antigen presentation, angiogenesis, inflammation, and coagulation. Exosomes represent a promising new frontier in drug delivery as they are non-toxic and non-immunogenic nature, and readily programmable to carry biomolecular cargoes such as nucleotides and proteins that can serve as biotherapeutics for the treatment of diseases.

Exosome services may include isolation and purification of exosomes from different biological samples, characterization of exosomes using various techniques such as electron microscopy, flow cytometry, and proteomic analysis, as well as functional studies to understand their role in specific biological processes or diseases. Additionally, exosome services may also involve exosome-based therapies, where exosomes are used as therapeutic agents for drug delivery or regenerative medicine purposes.
