Expandable interbody fusion cages are medical devices used in spinal fusion surgeries to treat conditions such as degenerative disc disease and instability. These cages are designed to be inserted into the intervertebral disc space between adjacent vertebrae. What sets them apart is their expandable feature, allowing surgeons to adjust the size of the cage once it's in place, optimizing the fit and support for the spine. This expandability helps restore disc height, decompress nerve roots, and stabilize the spine. The cages are typically made from materials like titanium or polymer, promoting fusion between vertebrae over time.

The global Expandable Interbody Fusion Cages market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.

The market for expandable interbody fusion cages is witnessing growth due to advancements in spinal surgery technologies and the increasing prevalence of spinal disorders. Expandable interbody fusion cages are used in spinal fusion procedures to stabilize the spine, promote fusion, and address conditions like degenerative disc disease. These cages can be adjusted in size during surgery, allowing for a customized fit and improved restoration of spinal alignment. The market is characterized by ongoing research and development efforts aimed at enhancing cage materials, design, and biomechanical properties. As the aging population grows and demand for minimally invasive spinal surgeries rises, the future development of expandable interbody fusion cages may involve further innovations in materials, surface technologies, and surgical techniques, ultimately improving patient outcomes and reducing the need for revision surgeries. Additionally, market expansion may be influenced by increased adoption in emerging markets and a focus on patient-centric approaches in spinal interventions.
