## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Expandable microsphere foam is a foaming agent whose interior is filled with gas or easily decomposable liquid and whose outer shell is made of thermoplastic polymer. After being heated to a certain temperature, the internal gas expansion or the decomposition of the liquid material will produce a large amount of gas, forming an internal high pressure, causing the microspheres to expand in volume and complete foaming. This kind of microsphere has good elasticity and can withstand great pressure without breaking. When cooled, the outer shell of the expanded microspheres hardens again to a fixed volume.

The global Expandable Microspheres Foam market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
