Expanded polymer microspheres are tiny spherical plastic particles consisting of a polymer shell and a gas (usually an alkane gas) encased in it. When heated to a certain temperature, the thermoplastic shell softens and the gas inside the shell expands, resulting in a greatly increased volume under the action of pressure. Due to their unique properties, such as low density, high expansion, good thermal stability, etc., expanded polymer microspheres have been widely used in many industries, such as coatings, inks, adhesives, rubber processing, etc., to improve product performance or to achieve specific process requirements.

The global Expanded Polymer Microspheres market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
