## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Explosion bonding is also known as explosive cladding, explosion welding. It is the bonding of two or more dissimilar metals with the aid of explosives. It is accomplished by a high-velocity oblique impact between two metals. The impact produces sufficient energy to cause the colliding metal surfaces to flow hydro dynamically when they intimately contact one another in order to promote solid-state bonding. The metal surfaces are compressed together under high pressure from the explosion, and an atomistic bonding between the dissimilar metals will be accomplished.

The global Explosion Bonding Metal Composites market size is projected to grow from US\$ 1070 million in 2024 to US\$ 1511 million in 2030; it is expected to grow at a CAGR of 5.9% from 2024 to 2030.
