Explosion Isolation Valve for Power Battery is a safety valve specifically designed for use in power batteries. Its primary function is to monitor the internal pressure and temperature within the battery cell. In the event of overpressure or overheating, which may occur due to factors such as overcharging, internal shorts, or external damage, the valve will automatically open or rupture along a pre-determined line to release the excess pressure and prevent an explosion. This mechanism helps to protect the structural integrity of the battery and ensures the safety of the surrounding environment and personnel.

Explosion isolation valves for power batteries are safety devices specifically designed to prevent the spread of explosions within battery systems. Their primary purpose is to improve the safety of these systems by isolating affected areas during an explosion, thereby limiting the damage and potential hazards that such events can cause.
