The global Expression of Difficult Proteins market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A difficult-to-express protein refers to a protein that poses challenges in achieving high-level production using conventional expression systems. These proteins may be inherently complex in structure, toxic to the host organism, prone to misfolding or aggregation, or require specific post-translational modifications for proper function. Strategies to overcome these challenges typically involve optimizing expression conditions such as temperature, media composition, and induction timing, as well as using alternative host organisms or expression systems like cell-free systems or yeast. Overcoming these hurdles is crucial for obtaining sufficient quantities of the protein for research, therapeutic development, or industrial applications.

United States market for Expression of Difficult Proteins is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
