The global Expulsion Fuses market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Expulsion fuses are protection devices that protect networks and equipment from current surges and overloads. An overcurrent will melt the fuse element in the carrier disconnecting the line or equipment. Expulsion fuse operation is based on two criteria: Melting open an element while building up adequate dielectric strength to clear a fault; Waiting for current to pass through reference point zero to clear the fault. Expulsion fuses do not absorb appreciable energy, which means they do not modify the circuit during the fault interruption process – hence being referred to as “zero-awaiting devices”.
