The global Exterior Wall Phenolic Insulation Board market size is predicted to grow from US$ 429 million in 2025 to US$ 657 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Exterior Wall Phenolic Insulation Board is a high-performance insulation material designed to address challenges in building exterior wall insulation, including insufficient fire resistance, high thermal conductivity, poor dimensional stability, and fire safety risks. Its core is made from a phenolic resin matrix that is foamed to create a closed-cell structure, providing excellent thermal insulation and fire retardancy while remaining lightweight. Originating from mid-20th century phenolic resin foaming technology, the product has evolved over decades through the integration of surface reinforcement, composite lamination, and optimized foaming agents, achieving wide application in exterior wall insulation. Its upstream raw materials include phenolic resin, curing agents, foaming agents, reinforcing materials, and surface films, with production relying on precise foaming control and curing processes to ensure low thermal conductivity, Class A fire resistance, and long-term dimensional stability, making it a key component of modern high-performance energy-efficient building systems.In 2024, the global production capacity of exterior wall phenolic insulation boards was 35,000 thousand square meters, with sales reaching 32,936 thousand square meters. The average selling price was 12.6 USD per square meter, and the average gross margin of enterprises ranged between 25% and 35%.

United States market for Exterior Wall Phenolic Insulation Board is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
