## Abstracts

The global Extracellular Matrix (ECM) market size is predicted to grow from US\$ 41.42 million in 2025 to US\$ 70.24 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

The extracellular matrix (ECM) is a complex network of proteins and carbohydrates that provides structural and biochemical support to the surrounding cells in tissues. It is composed of various molecules, including collagen, elastin, glycoproteins, and proteoglycans, which create a scaffold that maintains tissue integrity and regulates cellular behaviors such as adhesion, migration, proliferation, and differentiation. The ECM not only provides mechanical support but also plays a crucial role in cell signaling, influencing processes like wound healing, embryonic development, and tissue remodeling. The composition and properties of the ECM can vary significantly between different tissues, reflecting their specific functional requirements.
