The global Extracellular Matrix Scaffold market size is predicted to grow from US\$ 41.42 million in 2025 to US\$ 70.24 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

An extracellular matrix (ECM) scaffold is a three-dimensional structure composed of proteins, glycoproteins, and polysaccharides that mimic the natural ECM found in tissues. These scaffolds provide a supportive framework for cells to attach, grow, and differentiate, facilitating tissue regeneration and repair. They are often used in tissue engineering and regenerative medicine to create environments conducive to cell proliferation and function, aiming to restore damaged tissues or organs. ECM scaffolds can be derived from natural sources, such as decellularized tissues, or synthesized using biomaterials designed to replicate the properties of natural ECM. These scaffolds promote cellular activities by providing biochemical and mechanical cues that influence cell behavior, thus playing a crucial role in the development of functional tissue constructs?.
