The global Extraction Centrifuge market size is predicted to grow from US$ 731 million in 2025 to US$ 919 million in 2031; it is expected to grow at a CAGR of 3.9% from 2025 to 2031.

The extraction centrifuge is a new, fast and efficient mixing and separation equipment. The extraction centrifuge uses a motor to drive the drum to rotate at high speed. Two materials with different densities and immiscible with each other complete the mixing and mass transfer under the action of the shear force generated by the rotation of the drum or blades, and are quickly separated under the action of the centrifugal force generated by the high-speed rotation of the drum. This process mainly includes two stages: mixing and mass transfer and centrifugal separation, and the extraction centrifuge can automatically and continuously complete these two processes. The extraction centrifuge usually has the characteristics of compact structure, small size and light weight. The drum part may adopt a flat bottom or other special structural design to meet the separation needs of different materials. At the same time, the extraction centrifuge may also be equipped with additional functions such as panoramic glass windows, pollution-free design, explosion-proof, and movable to improve the practicality and safety of the equipment.

United States market for Extraction Centrifuge is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
