Mass transfer apparatus in which the dispersion of immiscible liquids occurs during mechanical mixing or by passing through perforated plates under applied pulsation.

We believe that the recovery of new coal chemical projects in recent years is not a simple economic cycle, but the joint effect of industrial technological breakthroughs, demonstration improvements, and expansion of oil-to-coal ratio, which has brought about the improvement of industrial production efficiency and the reduction of production costs, which has enhanced the competitiveness of the industry, making new coal chemical projects compete with petrochemical projects on the same platform for the first time. New coal chemical projects have changed from the original demonstration supplement to petrochemical projects to substantive domestic competition and substitution of low-end petrochemical products. The upward trend of the coal chemical equipment industry is just beginning.
