Extruder Conditioner is a key component in the extrusion process, commonly used in the production of animal feed, pet food, and various food products. Its primary function is to pre-treat raw materials before they enter the extruder barrel. This is achieved by injecting steam, moisture, and sometimes additives into the feed material while it is gently mixed and heated within the conditioner chamber. This conditioning process softens the ingredients, improves their cooking efficiency, and enhances starch gelatinization and protein denaturation. As a result, the extruder conditioner improves product quality, increases throughput, and reduces wear on the extruder, contributing to a more consistent and energy-efficient production process.
