Melt flow index tester, or extrusion plastometers, characterize the flow properties of a plastic melted mass. A method that is particularly useful in quality control and goods inwards testing, melt flow tests begin by heating the previously weighed out material within the extrusion barrel, which Converts the material into granules. A piston, along with a piston transducer, is placed into the extrusion barrel, and the test begins when the test weight puts pressure to the piston, forcing movement of the granules out of the instrument. Flow rate (MVR) can then be achieved by measuring the distance that the piston travels per unit of time.

Development of new technologies: The Extrusion Plastometer market is continuously developing new technologies that improve the accuracy and efficiency of extrusion testing. These advancements allow for more accurate predictions of material behavior during the extrusion process, leading to better product quality and performance.

Increased focus on process control and quality: Manufacturers are increasingly focused on process control and quality in order to meet stringent standards and regulations. Extrusion Plastometers provide accurate and reliable data on material properties and process parameters, enabling manufacturers to optimize their extrusion processes and

ensure consistent product quality.
