According to this study, the global Fabry Disease Treatment market size will reach US\$ 2490 million by 2031.

Fabry disease is a rare X-linked lysosomal storage disorder with a deficiency of alpha galactosidase enzyme resulting in progressive organ dysfunction. This disease is caused by abnormal buildup of a specific fatty matter called globotriaosylceramide in multiple tissues of the body including eyes, skin, kidney, gastrointestinal system, brain, heart, and central nervous system.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs. However, the industry also faces challenges such as stringent regulations, high costs of research and development, and patent expirations. Companies need to continuously innovate and adapt to these challenges to stay competitive in the market and ensure their products reach patients in need. Additionally, the COVID-19 pandemic has highlighted the importance of vaccine development and supply chain management, further emphasizing the need for pharmaceutical companies to be agile and responsive to emerging public health needs.
