## Abstracts

According to this study, the global Facility Decommissioning, Decontamination and Demolition market size will reach US\$ 88637 million by 2031.

Facility Decommissioning, Decontamination and Demolition refers to a series of systematic technical services carried out for various facilities (such as nuclear facilities, chemical facilities, industrial plants, etc.) that have reached their service life, have been eliminated due to technological upgrades, or have stopped operating due to safety reasons, in order to eliminate their potential risks and restore the safety status of the site. Facility decommissioning is the overall process of removing the regulatory control of the facility and making it safe to open or reuse, covering the full cycle management from shutdown preparation to final acceptance; decontamination is the use of physical (such as mechanical grinding, ultrasonic cleaning), chemical (such as acid and alkali dissolution), electrochemical or biological professional technical means to remove radioactive, chemical and other pollutants on the surface or inside of the facility to reduce radiation dose, reduce waste volume and improve resource recovery rate; demolition is the use of manual, mechanical, blasting or water cutting methods to disintegrate, demolish and clean the structures, equipment and systems of the facility to ensure that the demolition process is safe, controllable and meets environmental protection requirements. The three together constitute a complete technical chain for the safe disposal of facilities.
