Vision sensors, not to be confused with the digital sensors found within cameras, are a type of machine vision solution meant to perform simple presence/absence checks and provide pass/fail inspections in unstructured situations. The ability of a camera to take images is combined with the processing capacity of a computer to output results regarding the location, quality, and completeness of a produced part or product. Unlike other types of sensors, including fiber optic and ultrasonic sensors, vision sensors can handle multiple inspection points per target. Vision sensors can also detect products or packages by pattern, feature, and color. Vision sensors are widely used throughout industrial plants and industrial processes, to maintain the quality of products and to check that operational efficiency is being achieved. Barcodes, blot/stain detection, sizing and alignment, and many other characteristics can be determined without any contact taking place. Vision sensors lack the most sophisticated vision tools available on standalone machine vision systems but can perform a great number of vision tasks in factory automation and logistics environments. Vision sensors are also more affordable than machine vision systems and require less expertise to run.

The global Factory Automation Vision Sensors market size is projected to grow from US\$ 2800 million in 2024 to US\$ 7735 million in 2030; it is expected to grow at a CAGR of 18.5% from 2024 to 2030.
