The global Fall Detection Radar market size is predicted to grow from US\$ 38.21 million in 2025 to US\$ 141 million in 2032; it is expected to grow at a CAGR of 20.9% from 2026 to 2032.

Fall Detection Radar is a specialized radar system designed to detect falls in real-time, often used in healthcare, elderly care, and safety applications. It works by emitting radio waves that bounce off objects, including the human body. When a person falls, the radar detects the sudden change in movement or position, distinguishing a fall from normal activity. The system can be integrated into smart homes, healthcare facilities, or wearable devices to trigger immediate alerts, ensuring rapid assistance for individuals who have fallen. Fall detection radar is valued for its ability to function in low-visibility environments and provide non-invasive monitoring.

As the proportion of the elderly population continues to grow, falls have become one of the main risks that threaten their ability to live independently and their life safety, driving the demand for non-contact, high-precision monitoring equipment in medical institutions, nursing homes and families. Fall detection radar uses technologies such as millimeter waves to accurately identify human movements. It has the advantages of strong privacy protection and stable operation around the clock, and is widely used in scenarios such as smart homes, medical care, and community elderly care. At the same time, the integration of artificial intelligence algorithms and Internet of Things technologies has further improved the judgment accuracy and response speed of the radar system, accelerating its application in the field of health monitoring.
