A Falling Film Evaporator (FFE) is a vertical shell and tube heat exchanger with a vapor- liquid separator mounted at the bottom. Falling-film evaporators evolved as a means to solve the problems associated with the rising-film types. Specifically, the hydrostatic head necessary for the operation of rising-film units leads to problems with some heat-sensitive products. In falling-film evaporators, the feed liquor is introduced at the top tube sheet, and flows down the tubewall as a thin film. Since the film is moving in the direction of gravity rather than against it, a thinner and faster-moving film results, yielding higher heat-transfer coefficients and reduced contact times. There is no static head to affect the temperature driving force. This allows use of a lower temperature difference for units to operate in the film regime, and hence yields superior performance in handling heat-sensitive materials.

United States market for Falling Film Evaporators is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
