The global Fan Assisted Trench Heater market size is predicted to grow from US$ 491 million in 2025 to US$ 719 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

In 2024, global Fan Assisted Trench Heater production reached approximately 1117.8 K units, with an average global market price of around US$ 424.6 per unit.

A Fan Assisted Trench Heater is a modern heating solution designed to be installed within the floor trench of a building, combining natural convection with an integrated fan system to improve air circulation and heat distribution. Unlike purely natural convection trench heaters, this type uses low-noise fans to actively move warm air into the room, which significantly increases heating efficiency and ensures faster response times, particularly in larger or high-ceilinged spaces. Typically placed along windows, walls, or glazed facades, fan assisted trench heaters are ideal for combating cold downdrafts while maintaining an unobstructed architectural design. They are commonly used in offices, residential complexes, hotels, and commercial buildings where both aesthetics and performance are important, offering energy-efficient comfort heating without occupying wall or floor space.

The supply chain of Fan Assisted Trench Heaters includes upstream suppliers of metals, fans, motors, heat exchangers, and electronic controls, midstream manufacturers who integrate these components into finished heating systems through design, assembly, and testing, and downstream distributors, HVAC contractors, and end-users across residential, commercial, and public building projects.

The single-line production capacity of Fan Assisted Trench Heater is 88 to 95 K units
