The global Far Infrared Panel Heaters market size is predicted to grow from US\$ 78.36 million in 2025 to US\$ 97 million in 2032; it is expected to grow at a CAGR of 3.1% from 2026 to 2032.

Far Infrared Panel Heaters are a type of heating system that uses far-infrared radiation to warm objects and people directly, rather than heating the surrounding air.

Far infrared (FIR) radiation is a part of the electromagnetic spectrum with longer wavelengths than visible light. FIR heaters emit this type of radiation to generate heat. This radiation is safe and is often compared to the warmth of the sun. Unlike traditional heaters that heat the air, FIR heaters emit infrared radiation that directly heats objects and surfaces in its path. This can include furniture, walls, floors, and people. As a result, the heat feels more comfortable and is less likely to cause dryness or stuffiness in the air. Far infrared heaters are commonly used in residential, commercial, and industrial settings. They are often employed in spaces where quick and efficient localized heating is required, such as in bathrooms, bedrooms, yoga studios, and outdoor patios.
