Fatty Acid Synthase (FASN) Antibodies were produced by immunizing rabbits with synthetic peptide and KLH conjugates. Antibodies were purified by affinity-chromatography using epitope-specific peptide. FASN is a key enzyme involved in the production of saturated fatty acids in the liver and other organs and is the only enzyme in the human body capable of converting metabolized sugars into palmitate. Palmitate is a saturated fatty acid that serves as a building block for longer chain, polyunsaturated fatty acids and can directly interact with other proteins to sustain normal cell signaling and metabolic function. The overproduction of palmitate is a critical driver of cellular metabolic dysfunction that can drive development or progression of several different diseases. In patients with NASH, increased FASN-mediated palmitate synthesis in the liver is the source of three key drivers of the disease: excess accumulation of liver fat, inflammation and fibrosis. If left untreated, these can lead to cirrhosis of the liver, liver cancer and/or liver transplantation.
