FCC Refinery Catalysts, or Fluid Catalytic Cracking catalysts, are critical components in the petroleum refining process. They facilitate the breakdown of large, complex hydrocarbon molecules found in crude oil into smaller, more valuable fractions such as gasoline, diesel, and other products. These catalysts enhance the efficiency and selectivity of the cracking process, allowing refineries to maximize the yield of high-demand products while minimizing the production of less desirable byproducts. Typically composed of a combination of zeolites, binders, and matrix materials, FCC catalysts are designed to withstand the harsh conditions within the cracking unit and can be tailored to optimize performance based on specific refinery feedstocks and desired outputs.

The global FCC Refinery Catalysts market size is projected to grow from US\$ 1876 million in 2024 to US\$ 2316 million in 2030; it is expected to grow at a CAGR of 3.6% from 2024 to 2030.
