## Abstracts

The global Fe-Based Amorphous Alloy Ribbons market size is predicted to grow from US\$ 224 million in 2025 to US\$ 343 million in 2031; it is expected to grow at a CAGR of 7.4% from 2025 to 2031.

Fe-based amorphous alloy ribbons are a type of material that combines the properties of iron (Fe) with the unique structure of amorphous alloys. Amorphous alloys are characterized by their lack of long-range atomic order, which gives them unusual physical properties compared to traditional crystalline materials.

Fe-based amorphous alloy ribbons are typically produced by rapid quenching from the molten state. This process involves rapidly cooling a molten alloy to solidify it without allowing it to crystallize. By cooling the alloy quickly enough, the atoms do not have time to arrange into a crystalline structure, resulting in an amorphous structure.

Fe-based amorphous alloy ribbons have a variety of applications due to their unique combination of properties. They are often used in magnetic applications due to their high magnetic saturation and low coercivity, making them suitable for permanent magnets and magnetic recording media. They also have good corrosion resistance and high strength, making them useful in engineering applications where corrosion resistance and durability are important.

As a high-performance material, iron-based amorphous alloy strip is widely used in many fields. For example, in the fields of electric power, energy, environmental protection and other fields, iron-based amorphous alloy strips are used to make core components of transformers, generators, motors and other equipment. With the rapid development of these fields, the demand for iron-based amorphous alloy strips is also

growing. At the same time, with the rapid development of new energy vehicles, renewable energy and other emerging industries, the market demand for iron-based amorphous alloy strips will further expand.
