Fe-based nanocrystalline soft magnetic powder refers to a type of magnetic material that is composed of iron and other elements such as boron, silicon, and carbon. The

powder has nanoscale crystal grains, which are typically less than 100 nanometers in size.

These powders have excellent magnetic properties, including high saturation magnetization, high permeability, and low coercivity. They also exhibit low core loss and high thermal stability, making them ideal for use in a variety of applications such as power transformers, inductors, and motors.

The nanocrystalline structure of the powder provides unique advantages over traditional soft magnetic materials, including improved magnetic properties and reduced eddy current losses. Additionally, the small grain size of the powder allows for greater packing density and improved mechanical properties.
