Febuxostat can effectively reduce the risk of gout and hyperuricemia by stably controlling the patient's uric acid value.

Febuxostat is a uric acid production inhibitor. It is an activity that can hinder the production of blood uric acid in the body - xanthine oxidase. Then the body normally metabolizes excess uric acid from the body. Therefore, it will not increase the burden of liver and kidney, and patients with low liver and kidney function can also take this drug conveniently.

Over the next five years, LPI(LP Information) projects that Febuxostat will register a 11.0% CAGR in terms of revenue, reach US\$ 1590 million by 2023, from US\$ 850 million in 2017.
