Fecal calprotectin test is a non-invasive clinical laboratory test that is used as a protein biomarker for the diagnosis of gastrointestinal disorders such as inflammatory bowel diseases, gastrointestinal infections, celiac disease, and colorectal cancer. Calprotectin is a protein produced by the white blood cells. It is found in saliva, blood, stool, cerebrospinal fluid, and urine. Increase in level of calprotectin in stool is an indication of presence of gastrointestinal inflammation. Fecal calprotectin test is a quantitative measurement test that is usually carried out with the enzyme linked immunoassay (ELISA) technique. The test measures the level of inflammation in the bowel. Thus, it is inflammation specific and not disease specific. Fecal calprotectin test is primarily used as a protein biomarker in order to distinguish inflammatory bowel diseases such as Crohn's disease and ulcerative colitis from irritable bowel syndrome. This test also helps predict the relapse of the inflammatory bowel disease, therapeutic drug monitoring, and gastrointestinal disease prognosis.
