The global Fecal Transplant Treatment market size is predicted to grow from US\$ 1191 million in 2025 to US\$ 1681 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Fecal transplant treatment is a therapy that transplants functional flora from the feces of healthy donors into the patient's intestines to rebuild the balance of intestinal microorganisms and treat intestinal and extraintestinal diseases. Its core principle is to use healthy flora to inhibit pathogenic microorganisms, repair intestinal barrier function and regulate the immune system, and improve the pathological state caused by flora imbalance through flora transplantation. Fecal transplant treatment is suitable for exploratory treatment of Clostridium difficile infection (CDI), inflammatory bowel disease (IBD) (ulcerative colitis, Crohn's disease), irritable bowel syndrome (IBS), metabolic syndrome (obesity, diabetes), neurological diseases (autism, Parkinson's disease), etc.

From the perspective of the global market, fecal transplant treatment continues to develop. North America dominates the market, and companies such as OpenBiome and Finch Therapeutics are promoting commercialization. The European Union classifies FMT as an 'advanced therapeutic medicinal product (ATMP)' and requires standardized production. The United Kingdom and the Netherlands are leading in clinical trials and flora construction. In the Asia-Pacific region, the research progress in China and India is accelerating, but it will take a long time to achieve commercialization. The intensification of antibiotic resistance, breakthroughs in microbiome research, and the continuous improvement of regulatory policies are all driving the continuous development of fecal transplantation therapy. Manufacturers' competition focuses on standardized production and expanded indications. However, safety disputes, regulatory complexity, and patient acceptance all limit the rapid development of fecal transplantation therapy. In general,

fecal microbial transplantation is a milestone in microbiome medicine, and its commercialization potential is closely related to the depth of intestinal flora research and the maturity of the regulatory framework.
