Feed additives for methane mitigation are substances added to the diets of ruminant animals—such as cows and sheep—to reduce the amount of methane they produce during digestion. These additives work by altering the fermentation process in the animals' stomachs, inhibiting the microbes responsible for methane production without harming the animals' health or productivity. Common types include fats, tannins, nitrates, seaweed (like Asparagopsis), and synthetic compounds such as 3-NOP (3-nitrooxypropanol). By lowering enteric methane emissions, these feed additives play a significant role in reducing the environmental impact of livestock farming and supporting climate change mitigation efforts.
