## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Feed Grade Antioxidants are additives used in animal feed to prevent the oxidation of fats, oils, and fat-soluble vitamins, which can lead to rancidity and loss of nutritional value. By protecting these essential nutrients from oxidative damage, Feed Grade Antioxidants help maintain the quality and safety of the feed, ensuring that livestock receive the necessary nutrients for growth, health, and productivity. Commonly used Feed Grade Antioxidants include synthetic compounds like butylated hydroxytoluene (BHT) and butylated hydroxyanisole (BHA), as well as natural antioxidants such as tocopherols and rosemary extracts. These antioxidants play a crucial role in extending the shelf life of feed products, reducing waste, and supporting the overall health and well-being of animals.

The global Feed Grade Antioxidants market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
