Feed mycotoxin binders are additives used in animal feed to mitigate the harmful effects of mycotoxins, which are toxic compounds produced by certain molds and fungi. These toxins can contaminate feed ingredients and pose significant risks to animal health, leading to reduced productivity, compromised immune systems, and even severe illnesses. Mycotoxin binders work by adsorbing or binding to the mycotoxins in the gastrointestinal tract, preventing their absorption into the bloodstream and facilitating their excretion from the body. Common binders include clay minerals like bentonite and zeolite, as well as organic polymers. The use of mycotoxin binders is essential in safeguarding the health of livestock, ensuring feed safety, and minimizing economic losses in the agricultural industry.

The global Feed Grade Mycotoxins Binder market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
