The research report highlights the growth potential of the global Feed Grade Yeast market. Feed Grade Yeast are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Feed Grade Yeast. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Feed Grade Yeast market.

Yeasts have been used in feed for many years. Both the Bovine Spongiform Encephalopathy crisis (mad cow disease), and the increasing concern of customers about their diet have led to an increased use of 'clean' protein sources, such as Yeast, in animal feed.

Feed Yeast is in many cases brewer's yeast (although it can be baker's or distiller's or lactic yeast) which has been inactivated by heat treatment.

The various nutritional components of Feed Yeast - which are similar to those of Food Yeast - help the animals to metabolise proteins, lipids and carbohydrates. Yeast has a relatively high lysine content and Protein Efficiency Ratio. It also contains other nutrients such as glutathione, inositol and choline. Feed Yeast stimulates the growth of the infant and young in many animal species. It can also provide a widespread protection of

animals against diseases thanks to the stimulation of the immune system through yeast beta-glucans and mannans.

Glutathione is a sulphur containing tripeptide which is an important cellular antioxidant. Inositol and choline play an important role in liver and nervous tissue functions.

According to our Fee Research Center, in 2022, global total production of feed was about 1.2 billion tons. Key producing regions are Asia, Europe and North America, top ten countries hold about 65% of global feed production. China, United States, Brazil and India, as the top four countries, accounted for half of the total feed production.
