Abstracts

The global Feedforward Neural Networks market size is predicted to grow from US\$ 8677 million in 2025 to US\$ 21759 million in 2032; it is expected to grow at a CAGR of 14.1% from 2026 to 2032.

A Feedforward Neural Network (FNN) is a fundamental type of artificial neural network in which information flows strictly in one direction—from the input layer, through one or more hidden layers, to the output layer—without any feedback loops or recurrent connections. Each layer consists of neurons that apply a weighted linear transformation followed by a nonlinear activation function, enabling the network to learn complex input–output mappings. Because the network has no memory of past inputs, FNNs assume that samples are independent and identically distributed, making them well suited for tasks such as classification, regression, and function approximation where temporal or sequential dependencies are not required.
