A Femtosecond Green Laser is a laser system that emits ultra-short pulses of green light with a duration on the order of Femtoseconds (one quadrillionth of a second). The green color is obtained by frequency-doubling an infrared laser using Non-Linear Crystals. These lasers generate extremely high peak powers, allowing for precise and controlled material processing. They are used in various applications, including micromachining, bioimaging, spectroscopy, and scientific research. The short pulse duration enables precise and minimal thermal damage, making Femtosecond Green Laser ideal for delicate and highly accurate operations.

The global Femtosecond Green Laser market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
