The FeNO (Fractional exhaled Nitric Oxide) breath analyzer is a medical device used to measure the level of nitric oxide in a person's breath. Nitric oxide is a gas produced by the cells lining the airways, and its measurement can provide valuable information about airway inflammation. The FeNO breath analyzer works by having the individual exhale into the device. The exhaled breath is then analyzed to determine the concentration of nitric oxide present. The results are typically available immediately or within a short period, allowing for real-time assessment and adjustment of treatment plans. It can be performed in both adults and children, making it a useful tool in managing asthma in pediatric patients as well.

The global FeNO Breath Analyzer market size is projected to grow from US\$ 95 million in 2024 to US\$ 219 million in 2030; it is expected to grow at a CAGR of 15.0% from 2024 to 2030.
