Ferric chloride etching is a method of wet etching, a process used to shape the surface of materials such as metals, glass, and ceramics. This technique involves removing material through erosion by solutions, differing from dry etching, which uses gases and beams.

Ferric chloride etching is widely used in metal processing for its precision compared to traditional machining methods. It's particularly prevalent in the electronics industry for creating detailed wiring patterns on printed circuit boards (PCBs) and manufacturing IC lead frames. This technique is also used in the fine processing of metals and ceramics in various manufacturing industries and art for copper plate etching in printmaking.
